

Does reducing K preserve attainment per step and per second?

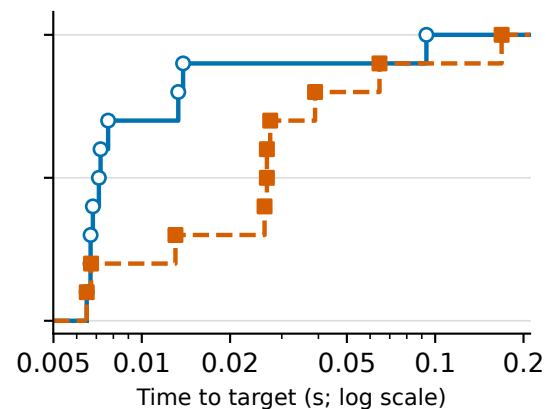

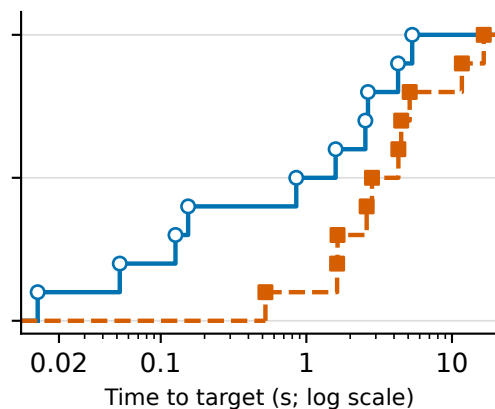

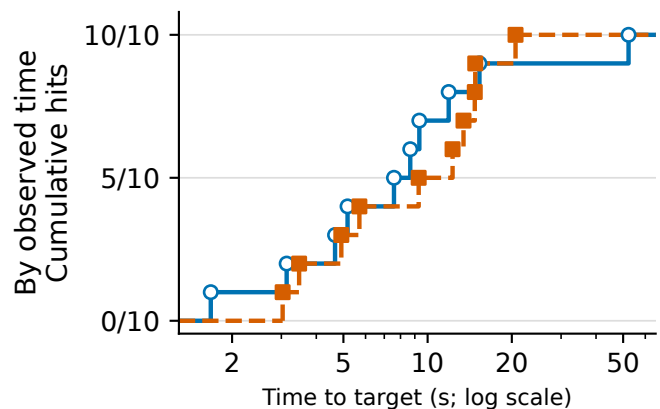

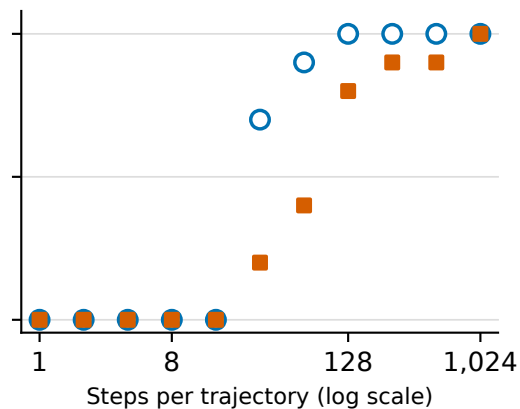

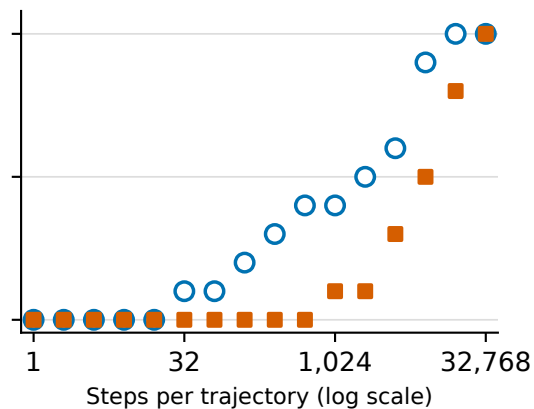

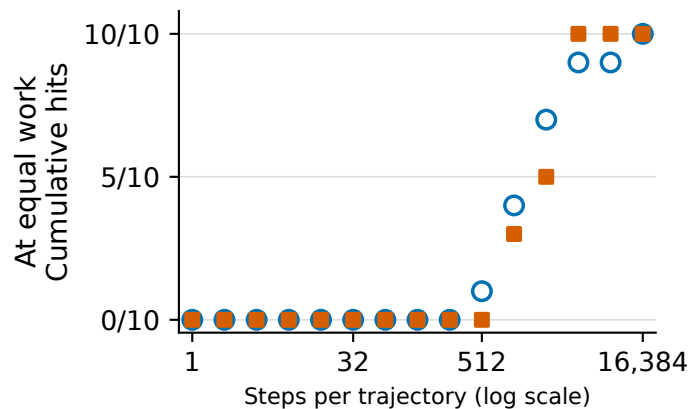

10 paired runs per method · n = 10 at each point · Fixed own targets

Original (K = 4) K = 2

4600 × 4400 · Large
Target 1,901,868 · H = 180 s

1300 × 1300 · Medium
Target 162,514 · H = 90 s

785 × 800 · Small
Target 92,740 · H = 90 s

Top: exact nominal work checkpoints. Bottom: empirical distribution of batch-observed times.

Axes differ by case. Both methods finish at 10/10; subsecond differences require cautious interpretation.
